

Hewlett Packard HPE Support Center Enterprise

v8.0.12 Release Notes

Abstract

Release notes for HPE Morpheus VM Essentials Software version v8.0.12

Notices

v8.0.12 LTS Release Notes

- Compatible Plugin API version: 1.2.13
- Compatible HPE Morpheus VM Essentials Worker version: 5.4.8+

Release Dates

- v8.0.12 December 2025

IMPORTANT

HPE has uncovered an issue related to the SCSI fencing agent used in HVM Clusters with GFS2 as the shared storage backend. Customers who have created new HVM Clusters using VME Manager version 8.0.11 or 8.0.12 are impacted. Customers using HVM Clusters created under VME Manager versions prior to 8.0.11 are not impacted even after upgrading to 8.0.11 or 8.0.12. Customers using HVM Clusters created under VME Manager versions 8.0.12-2 and higher also will not be affected. Under this issue, when an HVM Host in the HVM Cluster fails, all other nodes will lose access to the GFS2 datastore and running virtual machines will be powered off. This situation can be recovered by rebooting the HVM Cluster which will allow existing virtual machines to be powered on once again. To resolve this issue permanently, connect individually to all HVM Hosts in the HVM Cluster and run `sudo sed -i 's/!= "lost"/!= "xlost"/g' /usr/sbin/fence_scsi_hpevm`.

IMPORTANT

After upgrading to v8.0.12, it is required to also upgrade HVM Host agents as well. To upgrade HVM Host agents, navigate to the detail page for each HVM Host, expand the ACTIONS menu, and click "Upgrade Agent." This process must be undertaken on all HVM Hosts. Alternatively, you may select "Download Agent Script" to download a shell script to handle the upgrade. Connect to the HVM Host over a terminal session and run the downloaded script. The scripts are unique to each HVM Host so you must download all required scripts and run the correct script against the correct HVM Host.

New Features

Agent

- On VM or Host detail pages, HPE Morpheus VM Essentials now detects the version of the installed Agent on the workload and adds a banner recommending upgrade. The banner is not shown when no Agent is installed or when the latest version is already running. This works for both Linux and Windows workloads

Aruba CX Plugin

- Plugin version 1.7.0 has been released
- Added Leaf-spine support (EVPN) for network providers
- The VLAN name on the ArubaCX switches configuration will be using the format: "ArubaCX-Network-<vlanId>" (existing VLANs will not be modified)

API & CLI

- The Options API endpoint `/api/options/osTypes` now returns the `code` value in addition to the `name` and `id`, which were returned previously
- GET requests to the `/api/appliance-settings` endpoint now include a `vmeAppliance` attribute in the response which returns `true` for HPE Morpheus VM Essentials appliances and `false` for HPE Morpheus Enterprise appliances
- Read access to the `/api/library/operating-systems/os-types` endpoint is now available to HPE Morpheus VM Essentials appliances. Previously, a warning was returned indicating that the feature wasn't accessible for licensing reasons
- Added `/api/migrations` endpoint for creating, reading, and executing workload migrations (ex. migrating from VMware to HVM) via HPE Morpheus VM Essentials API. A corresponding `migrations` CLI command is also added for creating, reading, and executing migrations via HPE Morpheus VM Essentials CLI. See API and CLI documentation repositories for more specific use instructions
- CRUD actions can now be performed on affinity rules for VMware Clouds and for HVM clusters through HPE Morpheus VM Essentials API and CLI. See API and CLI documentation repositories for more specific use instructions

Networks

- VLAN trunk details can now be added to HPE Morpheus VM Essentials networks through API

Fixes

HPE Alletra MP Plugin

- Resolved an issue causing a null error when creating a ransomware-enabled datastore on HPE Primera storage systems.
- Resolved an issue that allowed creation of ransomware-enabled datastores on the HPE Alletra Storage R4 cluster.

- Resolved CVE vulnerabilities identified by security scans in HPE Morpheus VM Essentials plugin 1.5.0.
- Resolved an issue where cloned VMs failed to inherit ransomware-enabled policies.
- Resolved an issue in HPE Morpheus VM Essentials where cloned VM root volumes retained the name of the source VM.
- Resolved an issue where volume data is not displayed when adding the same storage server with its port.

API & CLI

- Fixed an issue that caused failures when detaching a volume from one HVM VM and attempting to attach it to another HVM VM using HPE Morpheus VM Essentials API

HVM

- Added logic to attempt cleanup of stale multipath devices during datastore sync
- Adding nodes to Instances migrated from VMware Clouds no longer gets stuck at the Finalizing state

NSX

- It's now possible to add virtual machines to NSX Groups (Infrastructure > Networks > Integrations > NSX Integration > Groups). Previously, the virtual machine search typeahead field would never show any results

phpIPAM

- Very large API responses from phpIPAM are now handled better

Known Issues

Alletra MP Storage Plugin

- Cluster configuration with both iSCSI and FC connected to Alletra isn't supported. Ensure only a single protocol is configured on the Cluster
- The plugin only handles thin provisioning regardless of whether the Instance is over-provisioned or thick provisioned
- No support for iface for Software iSCSI
- VM Migration to other hosts may fail under heavy write-iops load on the VM. Recommendation is to reduce write-iops prior to migration
- Virtual images created without a specified disk capacity will fail to provision if the associated disk size is smaller than the minimum required

- VM in shutdown state will not migrate to the new node until it's powered on
- If the default image store is created after the virtual image is uploaded, it may cause issues with VM provisioning. Workaround is to ensure the store is created prior to virtual image creation
- Reconfigure Instance with HPE Alletra MP datastore fails if there is an attached CD ROM. Workaround is to delete the CD Drive before performing any subsequent actions for reconfigure
- Mixed datastore type is not supported for snapshot related features. Workaround is to specify the Alletra datastore by changing the disk type to Standard, selecting the datastore, and changing back to CD ROM
- Ubuntu VM created using ISO fails to start after snapshot revert due to cdrom device becoming unmapped from the host during revert
- When a VM undergoes multiple root disk reconfigurations across different datastores, subsequent attempts to add a new disk from the Alletra datastore result in a false success report in the UI
- Cdrom not removed from VM created on Alletra plugin datastore after successful reconfiguration
- Additional cdrom and morpheus-image cdrom not removed after successful reconfiguration
- On Alletra version 10.4.x and below, provisioning failures can occur if the number of volumes on a storage server exceeds 500. The workaround is to remove orphaned/failed multipath devices on the host prior to provisioning or upgrade to Alletra version 10.5.0 or later

Cloning a VM fails when the VM is running in local storage and the configuration for the clone include storage provided by the Alletra plugin

HVM

- Attaching an ISO to the cdrom drive using the ACTIONS menu from the UI causes the VM to go into a stopped state
- VM provisioning fails when root disk type is selected as "Thick (eager)"
- VM restore fails when the VM contains multiple disks with varying types (standard, thick, thin) or storage controller types

Installer

- VM Essentials installer 1.0.7 fails to deploy VM Essentials manager version 8.0.6 when using TUI. Use version 1.0.8.
